

AICAS Combination Center

(Astronomical Institute of the Czech Acad.
Sci. and Czech Technical Univ.)

two strategies

a) “non- regular” combination

see Pešek, Kostecký: Simultaneous determination
of Earth orientation parameters and station
coordinates from combination of results of different
observation techniques (presented this Monday at G7
session)

b) „regular combination” from SINEX –
in early state of solution

solution based on results + covariance matrix or set
of normal equations

Demands of the Pilot project data:

- results of all techniques in SINEX format
(only IGS data available on 20th April 2004)
- local ties
