

IVS contribution to the ITRF2004 - Results & Validation

M. Vennebusch

Geodetic Institute of the University of Bonn

The IVS performs the intra-technique combination of VLBI sessions from 1980 till 2005. For the ITRF2004 about 2000 sessions have been combined and EOP and stations coordinates have been computed for checking the quality of the combined normal equations delivered to the IERS CPP.

In this talk the results of EOP and time series of coordinates derived by VLBI-SINEX-data will be presented as well as the results of comparisons with the products of other techniques.
